

# Form Energy Iron-Air Battery Modular Storage for Remote Mining Sites in Australia

## Form Energy Iron-Air Battery Modular Storage for Remote Mining Sites in Australia

### Why Mining Giants Are Betting on Iron-Air Battery Tech

A remote iron ore mine in Western Australia's Pilbara region, where diesel generators currently guzzle \$5 million worth of fuel annually. Now imagine replacing 80% of that with battery systems using... iron, air, and water. This isn't sci-fi - Form Energy's modular iron-air batteries could slash energy costs to \$20/kWh while providing 100-hour backup power. Let's unpack why Rio Tinto and BHP are eyeing this tech like prospectors spotting a new gold vein.

### The Energy Storage Holy Grail for Mining

4-6 day continuous power from single charge (vs lithium's 4-6 hours)

60% lower LCOE compared to diesel-solar hybrids

Non-flammable electrolyte safer than lithium-ion in bushfire zones

### How Iron-Air Batteries Solve Australia's Mining Energy Puzzle

Australian mines face a perfect storm: 42% energy cost inflation since 2020 combined with net-zero commitments. Traditional solutions? Lithium batteries need climate-controlled housing, while hydrogen requires \$20M+ infrastructure. Form's modular units work differently:

### Rust Never Sleeps (But Pays Dividends)

The battery's "reversible rusting" mechanism uses 50 metric tons of iron pellets per MW capacity. During discharge, iron oxidizes (rusts) to release electrons. Charging reverses the reaction using renewable energy - like a giant electrochemical Etch A Sketch.

### Case Study: Making the Numbers Work

Take a hypothetical 10MW mining operation:

Parameter

Diesel Generator

Iron-Air Battery Hybrid

Fuel Cost (Annual)

\$4.7M

\$1.2M

CO2 Emissions

28,000 tons

6,100 tons

Payback Period

N/A

3.8 years

Modular Deployment Advantages

Scale from 500kW to 50MW without redesign

Withstand 55°C ambient temperatures (critical for Pilbara summers)

30-minute module swap capability for maintenance

Overcoming Deployment Challenges

While promising, iron-air batteries aren't plug-and-play:

Water Requirements: Not Just a Drop in the Bucket

Each MW module consumes 150L/day for electrolyte management - challenging in arid regions.

Solutions being piloted:

Air-to-water condensation systems

Closed-loop recycling achieving 92% water recovery

The Road Ahead: 2025 Commercial Rollout

With Form Energy's West Virginia factory operational since Q3 2024, Australian miners can expect:

Local assembly partnerships reducing lead times

Customized DC coupling for existing solar farms

AI-powered charge management systems

# Form Energy Iron-Air Battery Modular Storage for Remote Mining Sites in Au

---

As Fortescue Metals CEO recently quipped: "We mine iron ore by day, store energy in iron by night - it's the ultimate vertical integration." While lithium batteries still handle short-term load shifts, iron-air solutions are poised to become the workhorses of Australia's mining energy transition.
