

## LG Energy Solution Prime+ Lithium-ion Storage Powers Texas Data Centers

### Why Texas Data Centers Need Bulletproof Energy Solutions

It's 107°F in Austin and every air conditioning unit in the metro area's data centers is screaming for power. This isn't hypothetical - during 2023's summer peak, Texas data centers consumed enough electricity to power 2.4 million homes. Enter LG Energy Solution's Prime+ lithium-ion storage systems, the technological equivalent of a fireproof safe for your digital assets.

### The Energy Storage Arms Race

Major players like Google and Microsoft now require minimum 8-hour backup systems for Texas installations. LG's 46120 battery cells (46mm diameter x 120mm height) deliver:

- 5X energy density vs previous models

- 15-minute emergency response capability

- 95% round-trip efficiency in real-world testing

### Case Study: San Antonio's Crypto Winter Savior

When February 2025's polar vortex knocked out power for 72 hours, a blockchain mining facility using Prime+ systems:

- Maintained 100% uptime during grid failure

- Reduced peak demand charges by \$1.2M annually

- Recovered installation costs in 18 months through ERCOT's ancillary market participation

### Thermal Runaway? More Like Thermal Walk-in-the-Park

LG's multi-phase cooling architecture handles Texas' temperature swings better than a cowboy handles a rodeo bull. The system's AI-driven thermal management:

- Predicts cell imbalances 47 minutes before occurrence

- Self-heals minor voltage discrepancies

- Integrates with fire suppression systems at microsecond response times

### The Battery Chemistry Behind the Magic

While everyone's chasing solid-state dreams, LG's NCMA (Nickel-Cobalt-Manganese-Aluminum) cathode formula delivers:

# LG Energy Solution Prime+ Lithium-ion Storage Powers Texas Data Center

---

30% longer cycle life than standard NMC cells  
Cobalt content reduced to
