How do electricity rates affect the economy in Mexico? In recent years, fluctuations in these rates have had a profound impact on the cost of living and the competitiveness of Mexican industries. For households, higher electricity rates can lead to increased monthly expenses, affecting disposable income and overall quality of life. Can a battery energy storage system complement a PV plant in Mexico? An analysis was carried out to verify if it would be commercially feasible to operate a Battery Energy Storage System (BESS) to complement the operation of a PV plant in the Mexican market. This PV plant would generate a revenue through the contracting via the , or LTAs in Mexico. How much does a power plant cost per MW? This value is in line with typical market conditions worldwide, where the contracted operation of such services is typically between 150,000 USD and 400,000 USD (3 to 8 million MXN) per MW and year. Why do we need energy storage? The current main driver for the need for energy storage is the fact that renewable energies in general, and particularly photovoltaic and wind power plants (variable Renewable Energies - vRE), are increasingly entering the electricity market whilst displacing conventional technologies. Should electrical energy storage systems be used in long-term power auctions? As being generally technology-agnostic, the use of Electrical Energy Storage Systems (EESS) within the long-term power auctions was neither explicitly encouraged nor discouraged. This analysis assumes that the EESS, more specifically the BESS, would be part of a solar PV plant. Is electrical energy storage system use case a source of revenue? An Electrical Energy Storage System use case for the capacity component only exists if a capacity component was awarded in the auctions. Therefore, no revenue can be generated from the results of the auctions due to a lack of awarded capacity bids. However, capacity is a possible source of revenue from the and auctions.
