Is energy storage a viable solution for the Finnish energy system? This development forebodes a significant transition in the Finnish energy system, requiring new flexibility mechanisms to cope with this large share of generation from variable renewable energy sources. Energy storage is one solution that can provide this flexibility and is therefore expected to grow. Is energy storage the future of wind power generation in Finland? Wind power generation is estimated to grow substantially in the future in Finland. Energy storage may provide the flexibility needed in the energy transition. Reserve markets are currently driving the demand for energy storage systems. Legislative changes have improved prospects for some energy storages. What are some examples of GWh-scale borehole thermal energy storage in Finland? Examples of larger GWh-scale borehole thermal energy storages built in Finland include one built at a logistics center in Sipoo and an underground parking lot in Turku. Normally, the depth of the boreholes for ground-source heating and in borehole thermal energy storages is a few hundred meters at most. How much wind power will Finland have by 2030? The range of wind power and electricity storage capacity estimated to be found in the Finnish electricity system by across the four different scenarios are listed in Table 2. The scenario with the highest amount of wind power had a combined onshore and offshore wind power capacity of 44 GW and a production of 141 TWh. How does the Finnish TSO respond to the growing number of renewable installations? The Finnish TSO, Fingrid, is continuously taking measures to respond to the fast-growing number of renewable installations. The power system is getting more complicated both from a technical and commercial perspective, with many large changes occurring simultaneously both in electricity production and consumption.
