Can a battery energy storage system complement a PV plant in Mexico? An analysis was carried out to verify if it would be commercially feasible to operate a Battery Energy Storage System (BESS) to complement the operation of a PV plant in the Mexican market. This PV plant would generate a revenue through the contracting via the , or LTAs in Mexico. How does cost of storage affect LCOE? As the fraction of electricity that is directly consumed decreases and the fraction of electricity that is stored beforehand increases, the impact of the cost of storage per energy throughput (also called levelized cost of storage or LCOS) on the LCOE increases. For renewable energy shares above 70%, long term storage is required. What are the costs and benefits of ESS projects? Costs and benefits of ESS projects are analyzed for different types of ownerships. We summarize market policies for ESS participating in different wholesale markets. Energy storage systems (ESS) are increasingly deployed in both transmission and distribution grids for various benefits, especially for improving renewable energy penetration. What is levelized cost of Storage (LCOS)? The common method for this is to use the levelized cost of storage (LCOS) approach, where a cost is assigned to storing and releasing a defined amount of energy (e.g. one kWh or one MWh) in a certain application without consideration of the actual size of the ESS. Should electrical energy storage systems be used in long-term power auctions? As being generally technology-agnostic, the use of Electrical Energy Storage Systems (EESS) within the long-term power auctions was neither explicitly encouraged nor discouraged. This analysis assumes that the EESS, more specifically the BESS, would be part of a solar PV plant. What is the Escondido energy storage project? The Escondido energy storage project is a fast response to the California Public Utility Commission's directions , however detailed costs and benefits of the Escondido energy storage project are not disclosed. As the fraction of electricity that is directly consumed decreases and the fraction of electricity that is stored beforehand increases, the impact of the cost of storage per energy throughput (also called levelized cost of storage or LCOS) on the LCOE increases. As the fraction of electricity that is directly consumed decreases and the fraction of electricity that is stored beforehand increases, the impact of the cost of storage per energy throughput (also called levelized cost of storage or LCOS) on the LCOE increases. Calculating the cost of energy storage in BCS 11. Conclusions and recommendations The present document introduces the results of a study carried out on the technical and commercial prefeasibility of integrating a Battery Energy Storage System (BESS) into an existing PV plant. The PV plant is a 15
